1 Introduction

MAS consists of a number of components (see ref. [1] for details). Most of MAS functionality is specified by the components' functionality. The purpose of this document is to specify functionality that is not suitable to specify in the components. One example is when functionality is general in a component, but used in a specific way by MAS.

Note: This document was created for the R4A release of MAS and may not be complete for functionality developed before R4A.

2 Function Requirements (Commercial)

This paragraph is intentionally left blank.

3 Function Specification (Design Related)

3.1 Services used by MAS

MAS is using the services below (on behalf of the executed application). The services are configured for the ExternalComponentRegister part of MAS.

- Storage
- Smtpstorage
- Userregister
- Userregisterwrite
- Eventreporting
- Speechrecognition
- Texttospeech
- Provisioning
- Accounting. Hosts are selected according to the MER algorithm. The information stated in section "Configure a Service" in ref. [2] applies to the Accounting service.

4 External Operation Conditions

This paragraph is intentionally left blank.

5 Capabilities

This paragraph is intentionally left blank.
